(57) **ABSTRACT**

A multi-band monopole antenna for a mobile communications device includes a common conductor coupled to both a first radiating arm and a second radiating arm. The common conductor includes a feeding port for coupling the antenna to communications circuitry in a mobile communications device. In one embodiment, the first radiating arm includes a space-filling curve. In another embodiment, the first radiating arm includes a meandering section extending from the common conductor in a first direction and a contiguous extended section extending from the meandering section in a second direction.

No. 7,411,556, and International Patent Application No. PCT/EP02/14706 are incorporated herein by reference.

BACKGROUND OF THE INVENTION

[0002] 1. Technical Field of the Invention

[0003] This invention relates generally to the field of multi-band monopole antennas. More specifically, a multi-band monopole antenna is provided that is particularly well-suited for use in mobile communications devices, such as Personal Digital Assistants, cellular telephones, and pagers.

[0004] 2. Description of Related Art

[0005] Multi-band antenna structures for use in a mobile communications device are known in this art. For example, one type of antenna structure that is commonly utilized as an internally-mounted antenna for a mobile communication device is known as an "inverted-F" antenna. When mounted inside a mobile communications device, an antenna is often subject to problematic amounts of electromagnetic interference from other metallic objects within the mobile communications device, particularly from the ground plane. An inverted-F antenna has been shown to perform adequately as an internally mounted antenna, compared to other known antenna structures. Inverted-F antennas, however, are typically bandwidth-limited, and thus may not be well suited for bandwidth intensive applications.

SUMMARY OF THE INVENTION

[0006] A multi-band monopole antenna for a mobile communications device includes a common conductor coupled to both a first radiating arm and a second radiating arm. The common conductor includes a feeding port for coupling the antenna to communications circuitry in a mobile communications device. In one embodiment, the first radiating arm includes a space-filling curve. In another embodiment, the first radiating arm includes a meandering section extending from the common conductor in a first direction and a contiguous extended section extending from the meandering section in a second direction.

[0007] A mobile communications device having a multi-band monopole antenna includes a circuit board, communications circuitry, and the multi-band monopole antenna. The circuit board includes an antenna feeding point and a ground plane. The communications circuitry is coupled to the antenna feeding point of the circuit board. The multi-band monopole antenna includes a common conductor, a first radiating arm and a second radiating arm. The common conductor includes a feeding port that is coupled to the antenna feeding point of the circuit board. The first radiating arm is coupled to the common conductor and includes a space-filling curve. The second radiating arm is coupled to the common conductor. In one embodiment, the circuit board is mounted in a first plane within the mobile communications device and the multi-band monopole antenna is mounted in a second plane within the mobile communications device.

BRIEF DESCRIPTION OF THE DRAWINGS

[0008] FIG. **1** is a top view of an exemplary multi-band monopole antenna for a mobile communications device;

[0009] FIG. **2** is a top view of an exemplary multi-band monopole antenna including one alternative space-filling geometry;

[0010] FIGS. **3-9** illustrate several alternative multi-band monopole antenna configurations;

[0011] FIG. **10** is a top view of the exemplary multi-band monopole antenna of FIG. **1** coupled to a circuit board for a mobile communications device;

[0012] FIG. **11** shows an exemplary mounting structure for securing a multi-band monopole antenna within a mobile communications device;

[0013] FIG. **12** is an exploded view of an exemplary clam-shell-type cellular telephone having a multi-band monopole antenna;

[0014] FIG. **13** is an exploded view of an exemplary candy-bar-style cellular telephone having a multi-band monopole antenna; and

[0015] FIG. **14** is an exploded view of an exemplary personal digital assistant (PDA) having a multi-band monopole antenna.

DETAILED DESCRIPTION OF THE DRAWINGS

[0016] Various embodiments of the present invention will now be described more fully with reference to the accompanying drawings. The invention may, however, be embodied in many different forms and should not be construed as limited to the embodiments set forth herein; rather, the embodiments are provided so that this disclosure will be thorough and complete, and will fully convey the scope of the invention to those skilled in the art. The above summary of the invention is not intended to represent each embodiment or every aspect of the present invention.

[0017] Referring now to the drawing figures, FIG. **1** is a top view of an exemplary multi-band monopole antenna **10** for a mobile communications device. The multi-band monopole antenna **10** includes a first radiating arm **12** and a second radiating arm **14** that are both coupled to a feeding port **17** through a common conductor **16**. The antenna **10** also includes a substrate material **18** on which the antenna structure **12**, **14**, **16** is fabricated, such as a dielectric substrate, a flex-film substrate, or some other type of suitable substrate material. The antenna structure **12**, **14**, **16** is preferably patterned from a conductive material, such as a metallic thick-film paste that is printed and cured on the substrate material **18**, but may alternatively be fabricated using other known fabrication techniques.

[0018] The first radiating arm **12** includes a meandering section **20** and an extended section **22**. The meandering section **20** is coupled to and extends away from the common

conductor **16**. The extended section **22** is contiguous with the meandering section **20** and extends from the end of the meandering section **20** back towards the common conductor **16**. In the illustrated embodiment, the meandering section **20** of the first radiating arm **12** is formed into a geometric shape known as a space-filling curve, in order to reduce the overall size of the antenna **10**. A space-filling curve is characterized by at least ten segments which are connected in such a way that each segment forms an angle with its adjacent segments, that is, no pair of adjacent segments define a larger straight segment. It should be understood, however, that the meandering section **20** may include other space-filling curves than that shown in FIG. **1**, or may optionally be arranged in an alternative meandering geometry. FIGS. **2-6**, for example, illustrate antenna structures having meandering sections formed from several alternative geometries. The use of shape-filling curves to form antenna structures is described in greater detail in the co-owned PCT Application WO 01/54225, entitled Space-Filling Miniature Antennas, which is hereby incorporated into the present application by reference.

[0019] The second radiating arm **14** includes three linear portions. As viewed in FIG. **1**, the first linear portion extends in a vertical direction away from the common conductor **16**. The second linear portion extends horizontally from the end of the first linear portion towards the first radiating arm. The third linear portion extends vertically from the end of the second linear portion in the same direction as the first linear portion and adjacent to the meandering section **20** of the first radiating arm **14**.

[0020] As noted above, the common conductor **16** of the antenna **10** couples the feeding port **17** to the first and second radiating arms **12**, **14**. The common conductor **16** extends horizontally (as viewed in FIG. **1**) beyond the second radiating arm **14**, and may be folded in a perpendicular direction (perpendicularly into the page), as shown in FIG. **10**, in order to couple the feeding port **17** to communications circuitry in a mobile communications device.

[0021] Operationally, the first and second radiating arms **12**, **14** are each tuned to a different frequency band, resulting in a dual-band antenna. The antenna **10** may be tuned to the desired dual-band operating frequencies of a mobile communications device by pre-selecting the total conductor length of each of the radiating arms **12**, **14**. For example, in the illustrated embodiment, the first radiating arm **12** may be tuned to operate in a lower frequency band or groups of bands, such as PDC (800 MHz), CDMA (800 MHz), GSM (850 MHz), GSM (900 MHz), GPS, or some other desired frequency band. Similarly, the second radiating arm **14** may be tuned to operate in a higher frequency band or group of bands, such as GPS, PDC (1500 MHz), GSM (1800 MHz), Korean PCS, CDMA/PCS (1900 MHz), CDMA2000/UMTS, IEEE 802.11 (2.4 GHz), or some other desired frequency band. It should be understood that, in some embodiments, the lower frequency band of the first radiating arm **12** may overlap the higher frequency band of the second radiating arm **14**, resulting in a single broader band. It should also be understood that the multi-band antenna **10** may be expanded to include further frequency bands by adding additional radiating arms. For example, a third radiating arm could be added to the antenna **10** to form a tri-band antenna.

[0022] FIG. **2** is a top view of an exemplary multi-band monopole antenna **30** including one alternative space-filling geometry. The antenna **30** show in FIG. **2** is similar to the multi-band antenna **10** shown in FIG. **1**, except the meandering section **32** in the first radiating arm **12** includes a different space-filling curve than that shown in FIG. **1**.

[0023] FIGS. **3-9** illustrate several alternative multi-band monopole antenna configurations **50**, **70**, **80**, **90**, **93**, **95**, **97**. Similar to the antennas **10**, **30** shown in FIGS. **1** and **2**, the multi-band monopole antenna **50** illustrated in FIG. **3** includes a common conductor **52** coupled to a first radiating arm **54** and a second radiating arm **56**. The common conductor **52** includes a feeding port **62** on a linear portion of the common conductor **52** that extends horizontally (as viewed in FIG. **3**) away from the radiating arms **54**, **56**, and that may be folded in a perpendicular direction (perpendicularly into the page) in order to couple the feeding port **62** to communications circuitry in a mobile communications device.

[0024] The first radiating arm **54** includes a meandering section **58** and an extended section **60**. The meandering section **58** is coupled to and extends away from the common conductor **52**. The extended section **60** is contiguous with the meandering section **58** and extends from the end of the meandering section **58** in an arcing path back towards the common conductor **52**.

[0025] The second radiating arm **56** includes three linear portions. As viewed in FIG. **3**, the first linear portion extends diagonally away from the common conductor **52**. The second linear portion extends horizontally from the end of the first linear portion towards the first radiating arm. The third linear portion extends vertically from the end of the second linear portion away from the common conductor **52** and adjacent to the meandering section **58** of the first radiating arm **54**.

[0026] The multi-band monopole antennas **70**, **80**, **90** illustrated in FIGS. **4-6** are similar to the antenna **50** shown in FIG. **3**, except each includes a differently-patterned meandering portion **72**, **82**, **92** in the first radiating arm **54**. For example, the meandering portion **92** of the multi-band antenna **90** shown in FIG. **6** meets the definition of a space-filling curve, as described above. The meandering portions **58**, **72**, **82** illustrated in FIGS. **3-5**, however, each include differently-shaped periodic curves that do not meet the requirements of a space-filling curve.

[0027] The multi-band monopole antennas **93**, **95**, **97** illustrated in FIGS. **7-9** are similar to the antenna **30** shown in FIG. **2**, except in each of FIGS. **7-9** the expanded portion **22** of the first radiating arm **12** includes an additional area **94**, **96**, **98**. In FIG. **7**, the expanded portion **22** of the first radiating arm **12** includes a polygonal portion **94**. In FIGS. **8** and **9**, the expanded portion **22** of the first radiating arm **12** includes a portion **96**, **98** with an arcuate longitudinal edge.

[0028] FIG. **10** is a top view **100** of the exemplary multi-band monopole antenna **10** of FIG. **1** coupled to the circuit board **102** of a mobile communications device. The circuit board **102** includes a feeding point **104** and a ground plane **106**. The ground plane **106** may, for example, be located on one of the surfaces of the circuit board **102**, or may be one layer of a multi-layer printed circuit board. The feeding point **104** may, for example, be a metallic bonding pad that is coupled to circuit traces **105** on one or more layers of the circuit board **102**. Also illustrated, is communication circuitry **108** that is coupled to the feeding point **104**. The communication circuitry **108** may, for example, be a multi-band transceiver circuit that is coupled to the feeding point **104** through circuit traces **105** on the circuit board.

[0029] In order to reduce electromagnetic interference from the ground plane **106**, the antenna **10** is mounted within the mobile communications device such that the projection of

the antenna footprint on the plane of the circuit board **102** does not intersect the metalization of the ground plane **106** by more than fifty percent. In the illustrated embodiment **100**, the antenna **10** is mounted above the circuit board **102**. That is, the circuit board **102** is mounted in a first plane and the antenna **10** is mounted in a second plane within the mobile communications device. In addition, the antenna **10** is laterally offset from an edge of the circuit board **102**, such that, in this embodiment **100**, the projection of the antenna footprint on the plane of the circuit board **102** does not intersect any of the metalization of the ground plane **106**.

[0030] In order to further reduce electromagnetic interference from the ground plane **106**, the feeding point **104** is located at a position on the circuit board **102** adjacent to a corner of the ground plane **106**. The antenna **10** is preferably coupled to the feeding point **104** by folding a portion of the common conductor **16** perpendicularly towards the plane of the circuit board **102** and coupling the feeding port **17** of the antenna **10** to the feeding point **104** of the circuit board **102**. The feeding port **17** of the antenna **10** may, for example, be coupled to the feeding point **104** using a commercially available connector, by bonding the feeding port **17** directly to the feeding point **104**, or by some other suitable coupling means. In other embodiments, however, the feeding port **17** of the antenna **10** may be coupled to the feeding point **104** by some means other than folding the common conductor **16**.

[0031] FIG. **11** shows an exemplary mounting structure **111** for securing a multi-band monopole antenna **112** within a mobile communications device. The illustrated embodiment **110** employs a multi-band monopole antenna **112** having a meandering section similar to that shown in FIG. **2**. It should be understood, however, that alternative multi-band monopole antenna configurations, as described in FIGS. **1-9**, could also be used.

[0032] The mounting structure **111** includes a flat surface **113** and at least one protruding section **114**. The antenna **112** is secured to the flat surface **113** of the mounting structure **111**, preferably using an adhesive material. For example, the antenna **112** may be fabricated on a flex-film substrate having a peel-type adhesive on the surface opposite the antenna structure. Once the antenna **112** is secured to the mounting structure **111**, the mounting structure **111** is positioned in a mobile communications device with the protruding section **114** extending over the circuit board. The mounting structure **111** and antenna **112** may then be secured to the circuit board and to the housing of the mobile communications device using one or more apertures **116**, **117** within the mounting structure **111**.

[0033] FIG. **12** is an exploded view of an exemplary clamshell-type cellular telephone **120** having a multi-band monopole antenna **121**. The cellular telephone **120** includes a lower circuit board **122**, an upper circuit board **124**, and the multi-band antenna **121** secured to a mounting structure **110**. Also illustrated are an upper and a lower housing **128**, **130** that join to enclose the circuit boards **122**, **124** and antenna **121**. The illustrated multi-band monopole antenna **121** is similar to the multi-band antenna **30** shown in FIG. **2**. It should be understood, however, that alternative antenna configurations, as described above with reference to FIGS. **1-9**, could also be used.

[0034] The lower circuit board **122** is similar to the circuit board **102** described above with reference to FIG. **10**, and includes a ground plane **106**, a feeding point **104**, and communications circuitry **108**. The multi-band antenna **121** is secured to a mounting structure **110** and coupled to the lower circuit board **122**, as described above with reference to FIGS. **10** and **11**. The lower circuit board **122** is then connected to the upper circuit board **124** with a hinge **126**, enabling the upper and lower circuit boards **122**, **124** to be folded together in a manner typical for clamshell-type cellular phones. In order to further reduce electromagnetic interference from the upper and lower circuit boards **122**, **124**, the multi-band antenna **121** is preferably mounted on the lower circuit board **122** adjacent to the hinge **126**.

[0035] FIG. **13** is an exploded view of an exemplary candy-bar-type cellular telephone **200** having a multi-band monopole antenna **201**. The cellular telephone **200** includes the multi-band monopole antenna **201** secured to a mounting structure **110**, a circuit board **214**, and an upper and lower housing **220**, **222**. The circuit board **214** is similar to the circuit board **102** described above with reference to FIG. **10**, and includes a ground plane **106**, a feeding point **104**, and communications circuitry **108**. The illustrated antenna **201** is similar to the multi-band monopole antenna shown in FIG. **3**, however alternative antenna configurations, as described above with reference to FIGS. **1-9**, could also be used.

[0036] The multi-band antenna **201** is secured to the mounting structure **110** and coupled to the circuit board **214** as described above with reference to FIGS. **10** and **11**. The upper and lower housings **220**, **222** are then joined to enclose the antenna **212** and circuit board **214**.

[0037] FIG. **14** is an exploded view of an exemplary personal digital assistant (PDA) **230** having a multi-band monopole antenna **231**. The PDA **230** includes the multi-band monopole antenna **231** secured to a mounting structure **110**, a circuit board **236**, and an upper and lower housing **242**, **244**. Although shaped differently, the PDA circuit board **236** is similar to the circuit board **102** described above with reference to FIG. **10**, and includes a ground plane **106**, a feeding point **104**, and communications circuitry **108**. The illustrated antenna **231** is similar to the multi-band monopole antenna shown in FIG. **5**, however alternative antenna configurations, as described above with reference to FIGS. **1-9**, could also be used.

[0038] The multi-band antenna **231** is secured to the mounting structure **110** and coupled to the circuit board **214** as described above with reference to FIGS. **10** and **11**. In slight contrast to FIG. **10**, however, the PDA circuit board **236** defines an L-shaped slot along an edge of the circuit board **236** into which the antenna **231** and mounting structure **110** are secured in order to conserve space within the PDA **230**. The upper and lower housings **242**, **244** are then joined together to enclose the antenna **231** and circuit board **236**.

[0039] This written description uses examples to disclose the invention, including the best mode, and also to enable any person skilled in the art to make and use the invention. The patentable scope of the invention is defined by the claims, and may include other examples that occur to those skilled in the art.

What is claimed:

1. A cellular telephone handset, comprising:
a device housing;
a display;
a keyboard;
a speaker;
a printed circuit board, the printed circuit board comprising:
a ground plane layer;
a feeding point;

a communication circuitry energized by means of a battery;

wherein the communication circuitry is mounted on the printed circuit board;

wherein the communication circuitry is coupled to the feeding point and to the ground plane layer;

an antenna including an antenna element;

wherein the antenna element operates in cooperation with the ground plane layer; the antenna element comprising:

a common conductor including a feeding port;

a first longer radiating arm connected to the common conductor;

a second shorter radiating arm connected to the common conductor;

wherein the feeding port is coupled to the feeding point;

wherein an orthogonal projection of a footprint of the antenna element on a plane of the printed circuit board overlaps the ground plane layer in less than fifty percent of an area of said footprint;

wherein the display, the speaker, the printed circuit board, the communication circuitry, and the antenna are arranged inside the device housing; and

wherein the antenna and the cellular telephone handset operate at multiple frequency bands.

2. The cellular telephone handset according to claim **1**, wherein the printed circuit board further comprises a plurality of circuit traces; and

wherein a circuit trace of the plurality of circuit traces couples the communication circuit to the feeding point.

3. The cellular telephone handset according to claim **2**, wherein the device housing comprises:

an upper housing, the upper housing including a window;

a lower housing, the lower housing adapted to receive the upper housing;

wherein the display is arranged with respect to the upper housing so as to be visible through the window; and

wherein the keyboard is arranged within the device housing so as to be accessible through the upper housing.

4. The cellular telephone handset according to claim **1**, wherein the first longer radiating arm is bent.

5. The cellular telephone handset according to claim **4**, wherein the first longer radiating arm comprises a first section extending away from the common conductor in a first direction and a second section extending in a second direction; and

wherein the second direction is different from the first direction.

6. The cellular telephone handset according to claim **5**, wherein the second direction is substantially opposite to the first direction.

7. The cellular telephone handset according to claim **5**, wherein the first section is at least partially shaped as a space-filling curve.

8. The cellular telephone handset according to claim **5**, wherein the first section is at least partially shaped as a substantially periodic meander line.

9. The cellular telephone handset according to claim **1**, wherein the communication circuitry comprises a transceiver able to operate at multiple frequency bands.

10. The cellular telephone handset according to claim **1**, wherein the cellular telephone handset comprises a mounting structure arranged within the device housing; and

the antenna element is arranged on at least one surface of the mounting structure.

11. The cellular telephone handset according to claim **10**, wherein the mounting structure is secured to the printed circuit board.

12. The cellular telephone handset according to claim **10**, wherein the mounting structure is secured to the device housing.

13. The cellular telephone handset according to claim **1**, wherein the antenna element is fabricated on a surface of a flexible substrate.

14. The cellular telephone handset according to claim **13**, wherein the flexible substrate comprises an adhesive layer; and

wherein the flexible substrate is affixed to the device housing.

15. The cellular telephone handset according to claim **1**, wherein the cellular telephone handset comprises:

a second printed circuit board;

mechanical connecting means; and

wherein the mechanical connecting means enables the second printed circuit board to move with respect to the printed circuit board, so that the cellular telephone handset can be switched between an open configuration and a closed configuration.

16. The cellular telephone handset according to claim **15**, wherein the second printed circuit board includes a second ground plane layer; and

wherein the cellular telephone handset comprises electrical connecting means that couple the ground plane layer and the second ground plane layer.

17. The cellular telephone handset according to claim **15**, wherein the mechanical connecting means comprises a hinge.

18. The cellular telephone handset according to claim **17**, wherein the cellular telephone handset is a clamshell-type cellular telephone handset.

19. The cellular telephone handset according to claim **17**, wherein the second printed circuit board includes a second ground plane layer; and

wherein the hinge comprises electrical connecting means that couple the ground plane layer and the second ground plane layer.

20. The cellular telephone handset according to claim **15**, wherein an orthogonal projection of the second printed circuit board substantially overlaps the first printed circuit board when the cellular telephone handset is in the closed configuration.
